

CONFIDENTIAL · PREPARED BY SAYER

American Bedding — HubSpot CPQ Implementation Proposal

Streamline your quoting process from four systems to one. Automate freight calculations. Give leadership full visibility into every quote.

A NOTE ON THIS PROPOSAL

A Living Document, Not a Final Blueprint

Proposals are inherently a starting point. This document reflects our understanding of your challenges from our **March 16 and March 23 discovery sessions**, a proposed solution, and the resources required to execute successfully.

We recognize that you, as the team that lives with these challenges daily, know details we have yet to uncover. Our goal is to use this as a conversation starter — to refine, align, and ensure we are solving the right problems in the right order.

If any aspect of the scope, solution, or pricing feels misaligned, let's use that as a basis for further discussion.

Our Commitment

This proposal is a living document. We are committed to refining the scope, solution, and investment until it is exactly right for American Bedding.

- Transparent communication throughout
- Phased delivery with clear milestones
- ROI-first approach to every decision

The Situation at a Glance

American Bedding is a Vesco portfolio company manufacturing mattresses for camps, educational institutions, and government agencies. With **NetSuite** launched **January 1, 2026** and HubSpot in place for CRM, the infrastructure is ready — but the quoting process is still fragmented across four systems.

The Problem Today

Caleb processes 65 quotes per week by jumping between NetSuite, Excel spreadsheets, Kuebix TMS, and HubSpot. Each quote takes 10 minutes to an hour. Sales leadership cannot see quote activity without logging into NetSuite separately.

Phase 1 — Weeks 1–12

HubSpot-Native CPQ. Product catalog sync from NetSuite, automated freight via Kuebix API, dynamic weight calculation, branded quote templates, and full quote-to-order integration — all built with HubSpot custom code actions.

Phase 2 — Weeks 13–18

Production Platform. Migrate the integration engine to a dedicated cloud API for unlimited performance, full test coverage, and long-term maintainability. Eliminates all HubSpot execution constraints.

- ❏ **Why this approach?** Inside sales represents 65% of revenue and 65 quotes per week of manual effort. Phase 1 gets reps quoting in HubSpot as fast as possible — delivering immediate ROI. Phase 2 builds the production foundation for scale.

How a Quote Gets Built — Future State

HubSpot CPQ is the quoting interface. Custom code actions and a dedicated cloud API orchestrate data flow between three systems. NetSuite remains the ERP source of truth. Total time per quote: under 5 minutes for standard orders.

This end-to-end workflow replaces the current four-system manual process with a single, automated sequence — from product selection through freight calculation to customer delivery, all within HubSpot.

Technology Stack

HubSpot Sales Hub Pro + Commerce Hub Pro (existing) · Operations Hub Pro (required)		NetSuite ERP Existing · REST API with OAuth 2.0 M2M authentication
Kuebix TMS Existing · Shipment API with Basic Auth for multi-carrier LTL rates		Railway Cloud platform for production API hosting (Phase 2) · ~\$5–20/month

Four Systems. One Broken Process.

After launching NetSuite on January 1, 2026, American Bedding has solid systems in place — but they are not connected where it matters most: the quoting process.

10+ Hours Per Week Lost to System Juggling

Every quote requires four systems in sequence: NetSuite for pricing, Excel for weight calculations, Kuebix for freight rates, then back to NetSuite to assemble the quote. At 65 quotes per week, even 10 minutes of unnecessary work per quote adds up to **10+ hours of wasted time weekly.**

Zero Quote Visibility in HubSpot

Quotes live in NetSuite. HubSpot shows deal stages and amounts — but not the quotes themselves. Sales leadership cannot see quote details, versions, edits, or approval status without switching systems. Pipeline reporting is incomplete.

Manual Freight Calculation Is the Bottleneck

Weight and freight class data lives in five Excel spreadsheets maintained on individual desktops — not in any centralized system. Each freight quote requires manual lookup, Kuebix entry, waiting for carrier rates, then manual re-entry into the quote.

No Protection Against Quoting Blocked Customers

Customer credit holds are tracked manually. There is no automated flag to prevent quoting to customers with overdue payments. A quote goes out, an order ships, and collections discovers the customer already owed money.

This is not a technology problem. The technology exists. It is a **connection problem** — four capable systems that do not talk to each other during the most critical revenue operation.

Ten Measurable Outcomes

Each objective is tied to a specific, measurable business result — not a feature list.

01	02	03
Single-Interface Quoting Sales reps create, edit, and send quotes entirely within HubSpot. No system-jumping for standard inside sales quotes.	Automated Freight Calculation Kuebix API integration calculates multi-carrier LTL shipping rates automatically. Cheapest rate auto-selected with manual override option.	Dynamic Weight Engine Replaces five Excel spreadsheets with an automated calculation engine — size, foam density, cover material, innerspring type, packaging. Handles standard and custom configurations.
04	05	
Product Catalog in HubSpot All 700 SKUs synced from NetSuite with pricing, specifications, and custom attributes. Automated sync ensures HubSpot always reflects current NetSuite pricing.	Quote-to-Order Automation Accepted quotes automatically create Estimates in NetSuite. Approved estimates convert to Sales Orders, triggering production work orders. No manual re-entry.	
06 — Branded Quote Templates Professional PDFs matching your current format — line items, volume discounts, state-based tax, freight, terms, customer acceptance.	07 — Credit Hold Visibility Customer credit status from NetSuite surfaces in HubSpot before quote creation. Reps see hold flags before investing time in a blocked customer.	08 — Volume Discount & Tax Automation 10% volume discount logic and state-based tax calculation built into the quoting workflow. Consistent pricing across all reps.
		09 — Multi-Warehouse Freight Routing Freight quotes automatically use the correct origin warehouse. No manual warehouse selection for standard orders.
10 — Full Quote Visibility for Leadership Quote activity, versions, edits, approvals, and cancellations visible in HubSpot dashboards. Pipeline reporting includes quote data, not just deal stages.		

Phase 1 — HubSpot-Native CPQ (Weeks 1–12)

Foundation (Weeks 1–4)

CPQ Architecture & Configuration Commerce Hub CPQ module activation, custom deal/quote/line item properties, quote approval workflows, quote numbering, payment terms configuration.

Product Catalog Sync All 700 SKUs extracted from NetSuite via SuiteQL and loaded into HubSpot with custom properties: weight components, freight class, dimensions, cover type, foam series, and construction type. Automated sync keeps pricing current.

NetSuite Integration OAuth 2.0 M2M authentication. Customer data sync including credit status and payment terms. Price level synchronization. The data backbone connecting your ERP to your quoting interface.

Integration (Weeks 5–8)

Kuebix Freight Integration HubSpot custom code connects quotes to Kuebix’s multi-carrier LTL rate shopping API. Collects weights and dimensions, determines shipping origin, requests rates from all carriers, writes the best rate as a freight line item. Manual override available.

Dynamic Weight Calculation Engine Replaces five Excel spreadsheets with a modular engine. Each product line gets its own module — Dorm Mattresses, Camp Mattresses, Dura-Last, SoFlux, and Vinyl — with shared utilities for common math.

Quote Template Design Custom HubSpot quote template matching your current NetSuite format. Line items, subtotal, volume discount, state-based tax, shipping, total, damaged freight policy, delivery instructions, and customer acceptance flow.

Launch (Weeks 9–12)

1

Quote-to-Order Bridge

Customer accepts → Estimate created in NetSuite → Estimate converts to Sales Order → production work orders triggered. No manual re-entry between systems.

2

Testing & Validation

End-to-end integration testing across all three systems. Quote accuracy validated against five NetSuite example quotes. Two UAT sessions with Caleb and Don.

3

Training

Sales team sessions (Caleb, Don) and admin sessions (Sarah-Beth, Patrick). All virtual, recorded for future onboarding. Admin guide and user quick reference card delivered.

4

Go-Live & Hypercare

Go-live cutover with 2-week hypercare period. Monitoring of integration flows, freight accuracy, and quote template rendering. Issue resolution and adjustment support.

Phase 2 — Production Platform (Weeks 13–18)

Scale and harden. Migrate the integration engine to a dedicated cloud API for unlimited performance, full test coverage, and long-term maintainability. Eliminates all HubSpot execution constraints.

Hardening (Weeks 13–16)

Production API Setup Dedicated cloud-hosted API with automated deployment, environment management, health monitoring, and error logging. Version-controlled codebase that any developer can maintain.

Weight Engine Migration All five product-line modules and shared utilities migrated with comprehensive test coverage. Each module validated cell-by-cell against its original Excel file — construction constants and seam allowances are product-specific and cannot be derived by analogy.

Freight & NetSuite Migration Kuebix freight orchestration and NetSuite integration logic migrated to the production API. Multi-line, multi-carrier quotes process without timeout risk. Proper retry logic for carrier API failures. OAuth token management with automatic refresh.

Finalization (Weeks 17–18)

Integration Rewiring HubSpot custom code actions updated to call the production API instead of running logic locally. HubSpot becomes a thin trigger layer — all heavy processing happens on the dedicated platform.

Regression Testing Full regression suite validates that every workflow from Phase 1 operates identically on the new platform. Load testing at production volume (65+ quotes/week). Performance benchmarking.

Documentation Update Updated admin guide and architecture documentation reflecting the production platform. Handoff materials for ongoing maintenance.

- Phase 2 eliminates all HubSpot execution time constraints — handles any product configuration at any complexity, at any volume.

18 Weeks. Two Phases. Fixed Fee.

Investment Summary

Phase	Scope	Timeline	Fee
Phase 1 (V1)	HubSpot-Native CPQ	Weeks 1–12	\$30,000
Phase 2 (V2)	Production Platform	Weeks 13–18	\$11,500
Total		18 weeks	\$41,500

No hourly billing. No overages within the defined scope per phase. All invoices are Net-15, structured as equal installments invoiced every 15 days throughout each phase.

Phase 1 Payment Schedule

5 equal payments of \$6,000 invoiced every 15 days

Phase 2 Payment Schedule

3 equal payments of ~\$3,835 invoiced every 15 days

 **Additional License Requirements:** Operations Hub Professional (~\$800/month) — required for custom code actions powering integration logic in Phase 1. Railway hosting (~\$5–20/month) — production API hosting for Phase 2.

The Return on This Investment

“We are not buying new software. We are connecting the software we already own.”

\$38K–\$58K

Year 1 Return

Conservative annual savings from time alone — before accounting for error reduction or increased quote capacity

6–8mo

Phase 1 Payback

Phase 1 pays for itself before Phase 2 begins, using only quantifiable, conservative estimates

93%

Max Year 1 ROI

Year 1 ROI range of 27%–93% on Phase 1 alone, excluding revenue uplift from faster turnaround

10+hrs

Weekly Time Saved

Hours returned to Caleb and the sales team for revenue-generating activities every single week

Time Savings Breakdown

Activity	Current State	Future State	Annual Savings
System navigation per quote	4 systems, 10–60 min per quote	1 system, under 5 min per quote	\$24,000–\$38,000
Manual weight calculation	Excel lookup per product line, per quote	Automated from product specs	\$6,000–\$10,000
Manual freight entry	Kuebix manual entry, wait for carrier	Kuebix API auto-response in seconds	\$5,000–\$7,000
Quote re-entry to NetSuite	Manual estimate and sales order creation	Automated quote-to-order bridge	\$3,000–\$5,000

Next Steps

- 1

Pre-Engagement Review —  COMPLETE

Sayer reviewed and validated all 5 Excel shipping calculator files (April 4, 2026). Dynamic weight engine scope confirmed. No hidden complexity found.
- 2

Written Approval

Provide written approval of this proposal via email, signed by Mike Taylor or Patrick.
- 3

Schedule Kickoff

Project kickoff within 1–2 weeks of written approval.
- 4

Execute MSA

Sayer will issue a Master Services Agreement via DocuSign with this Scope of Work included.
- 5

Begin Implementation

Once the MSA is executed, Sayer will finalize the implementation plan and begin Week 1 activities.
